CMPE-242:
 APPLIED FEEDBACK CONTROL

HOMWORK #1
 DUE 30-SEPT-2010

1. *Equations of Motion:* Consider the very simple mechanical system below:

- Write down the equations of motion (E.O.M.).
 - Integrate the equations of motion to find the response to a step input ($F(t) = \mathbf{1}(t)$).
 - Integrate the equations of motion to find the response to an impules ($F(t) = \delta(t)$).
 - Use the convolution integral to find the response to a step input (meaning: use $h(t)$ from your answer to part (c), and $F(t) = \mathbf{1}(t)$).
2. *Block diagram reduction:* Write down the transfer function $[Y(s)/U(s)]$ of the block diagram below:

3. *Laplace transform:* Solve the following constant coefficient ordinary differential equations using Laplace Transforms and partial fraction expansion:
- $\ddot{y}(t) - 2\dot{y}(t) + 4y(t) = 0$ where $y(0) = 1$ and $\dot{y}(0) = 2$
 - $\ddot{y}(t) + 3y(t) = \sin t$ where $y(0) = 1$ and $\dot{y}(0) = 2$
 - $\dot{y}(t) + 2y(t) = e^t$ where $y(0) = 1$ and $\dot{y}(0) = 2$

4. *Transfer Functions*: Given the following mass-spring system, derive the transfer function from the position of both of the masses to the forcing function: $[X_2(s)/F(s)$ and $X_1(s)/F(s)]$:

5. *Transfer Functions*: Given the following simple electrical system, derive the transfer function from the input voltage to the output voltage $[V_2(s)/V_1(s)]$:

6. *Dynamic Response*: Given the following third order system:

$$H(s) = \frac{\alpha \omega_n^2}{(s + \alpha)(s^2 + 2\zeta \omega_n s + \omega_n^2)}$$

- a. Show that the response to a unit step ($U(t)=1(t)$) is:

$$y(t) = 1 + Ae^{-\alpha t} + Be^{-\sigma t} \sin(\omega_d t - \varphi)$$

where:

$$A = \frac{-\omega_n^2}{(\omega_n^2 + 2\zeta \omega_n \alpha + \alpha^2)}$$

$$B = \frac{\alpha}{\sqrt{(\omega_n^2 - 2\zeta \omega_n \alpha + \alpha^2)(1 - \zeta^2)}}$$

$$\varphi = \text{TAN}^{-1} \frac{\sqrt{1 - \zeta^2}}{-\zeta} + \text{TAN}^{-1} \frac{\omega_n \sqrt{1 - \zeta^2}}{\alpha - \zeta \omega_n}$$

- b. Which term dominates as α gets large?
 c. Which term dominates as α gets small?
 d. Approximate A and B for small values of α .
 e. Assume that $\omega_n = 1$ and $\zeta = 0.707$, plot the step response for several values of α . Use MATLAB's *step* command (could you use *impulse*? How?) Comment on where the extra pole becomes unimportant.
